SUPPLIER PROPOSAL

BrightPath Tech

Lowest price and shortest schedule, with limited compliance evidence

Procurement request: Supplier Onboarding and Procurement Workflow Platform

Document type: Fictional RFP response for classroom / mini-project evaluation

Proposal ID: SYN-RFP-2026-02

Submission date: 2026-03-12

Confidentiality and assumptions

This is synthetic training data. Supplier names, prices, delivery commitments, project histories, and security statements are fictional and must not be treated as real vendor claims. All prices are illustrative USD estimates and exclude taxes unless stated otherwise.

1. Executive Summary and Requirement Understanding

BrightPath offers a lean implementation focused on essential supplier intake, approvals, and reporting. It has the lowest cost and fastest schedule in this comparison, but the proposal provides limited security documentation and few comparable references.

The buyer is seeking a configurable platform to manage supplier intake, review and approval workflows, document tracking, reporting, and integration with existing enterprise systems. The solution should be secure, auditable, maintainable, and support a controlled production rollout.

2. Proposed Solution and Technical Approach

A single web application with a lightweight API layer and managed relational database. Standard CSV import/export and a small set of REST integrations are included. Advanced workflow customization and high-volume event processing are out of scope unless separately estimated.

Delivery approach: use version-controlled configuration, documented interface contracts, automated tests, environment separation, operational logging, and an agreed acceptance checklist. Any scope not explicitly described above should be confirmed during discovery and recorded through change control.

3. Implementation Plan and Milestones

Phase	Duration	Deliverable
Kickoff and configuration	1 week	Requirements checklist
Build	4 weeks	Core forms, approvals, reports
Customer testing	1 week	Defect fixes and acceptance
Launch	1 week	Production deployment

Team structure

Proposed team: delivery/project manager, solution architect, application engineers, integration engineer, QA engineer, and security/operations representative. Exact named resources and allocation percentages are to be agreed at contract finalization. The supplier will provide weekly status, decision log, RAID log (risks, assumptions, issues, dependencies), and milestone acceptance records.

4. Commercial Proposal

Cost item	Amount (USD)
Implementation	72,000
Annual support	12,000
Cloud / hosting estimate	9,000 per year
Total first-year estimate	93,000

Commercial assumptions

Estimates assume the scope described in this response, timely access to buyer stakeholders and test environments, and availability of documented interfaces. Taxes, major third-party license fees, data migration beyond agreed templates, and out-of-scope connectors are excluded unless explicitly listed. Any recurring cloud estimate is indicative and depends on actual workload, storage, retention, and availability requirements.

5. Security, Compliance, and Risk Controls

HTTPS is supported and access is controlled by application roles. The proposal does not identify independent security certifications, a formal penetration-testing cadence, detailed incident response SLAs, or a complete data-retention policy. These should be treated as open questions before award.

Key risks / open items

• Security and compliance evidence is incomplete

• Fast timeline assumes limited integration scope

• Reference experience is limited and not independently documented

6. Support, Experience, and References

Business-hours email support with a stated one-business-day initial response target. The proposal mentions two small workflow projects but does not include named references or quantified production scale.

Relevant experience: Two small workflow projects; references not included

Integration summary: Basic REST and CSV integrations; complex integrations require change control

7. Proposed Acceptance Criteria

The supplier recommends acceptance based on successful completion of agreed workflow scenarios, API integration tests, role/access tests, audit-log verification, security review, performance tests at a buyer-approved load profile, backup/restore validation, operational runbooks, and user acceptance sign-off. Final thresholds should be documented in the statement of work.

8. Summary of Strengths and Limitations

Commercial value and speed are strongest; compliance, support depth, and experience are weaker.

This proposal intentionally contains both positive evidence and open questions so that an evaluator can score it against weighted criteria. Evaluators should use only statements present in this document and record evidence snippets for each criterion.
